

# Version Control

Managing codebases since 1990

# What's Version Control?

Version Control (VCS) is software you can use to track changes to a project over time, consolidate changes between contributors, and backup your work.

If you don't use a VCS, you could end up like this:

# Types of Version Control

## Centralized (CVCS)

- Changes tracked against central remote repository
- Cannot maintain local tree
- Helpful for large projects

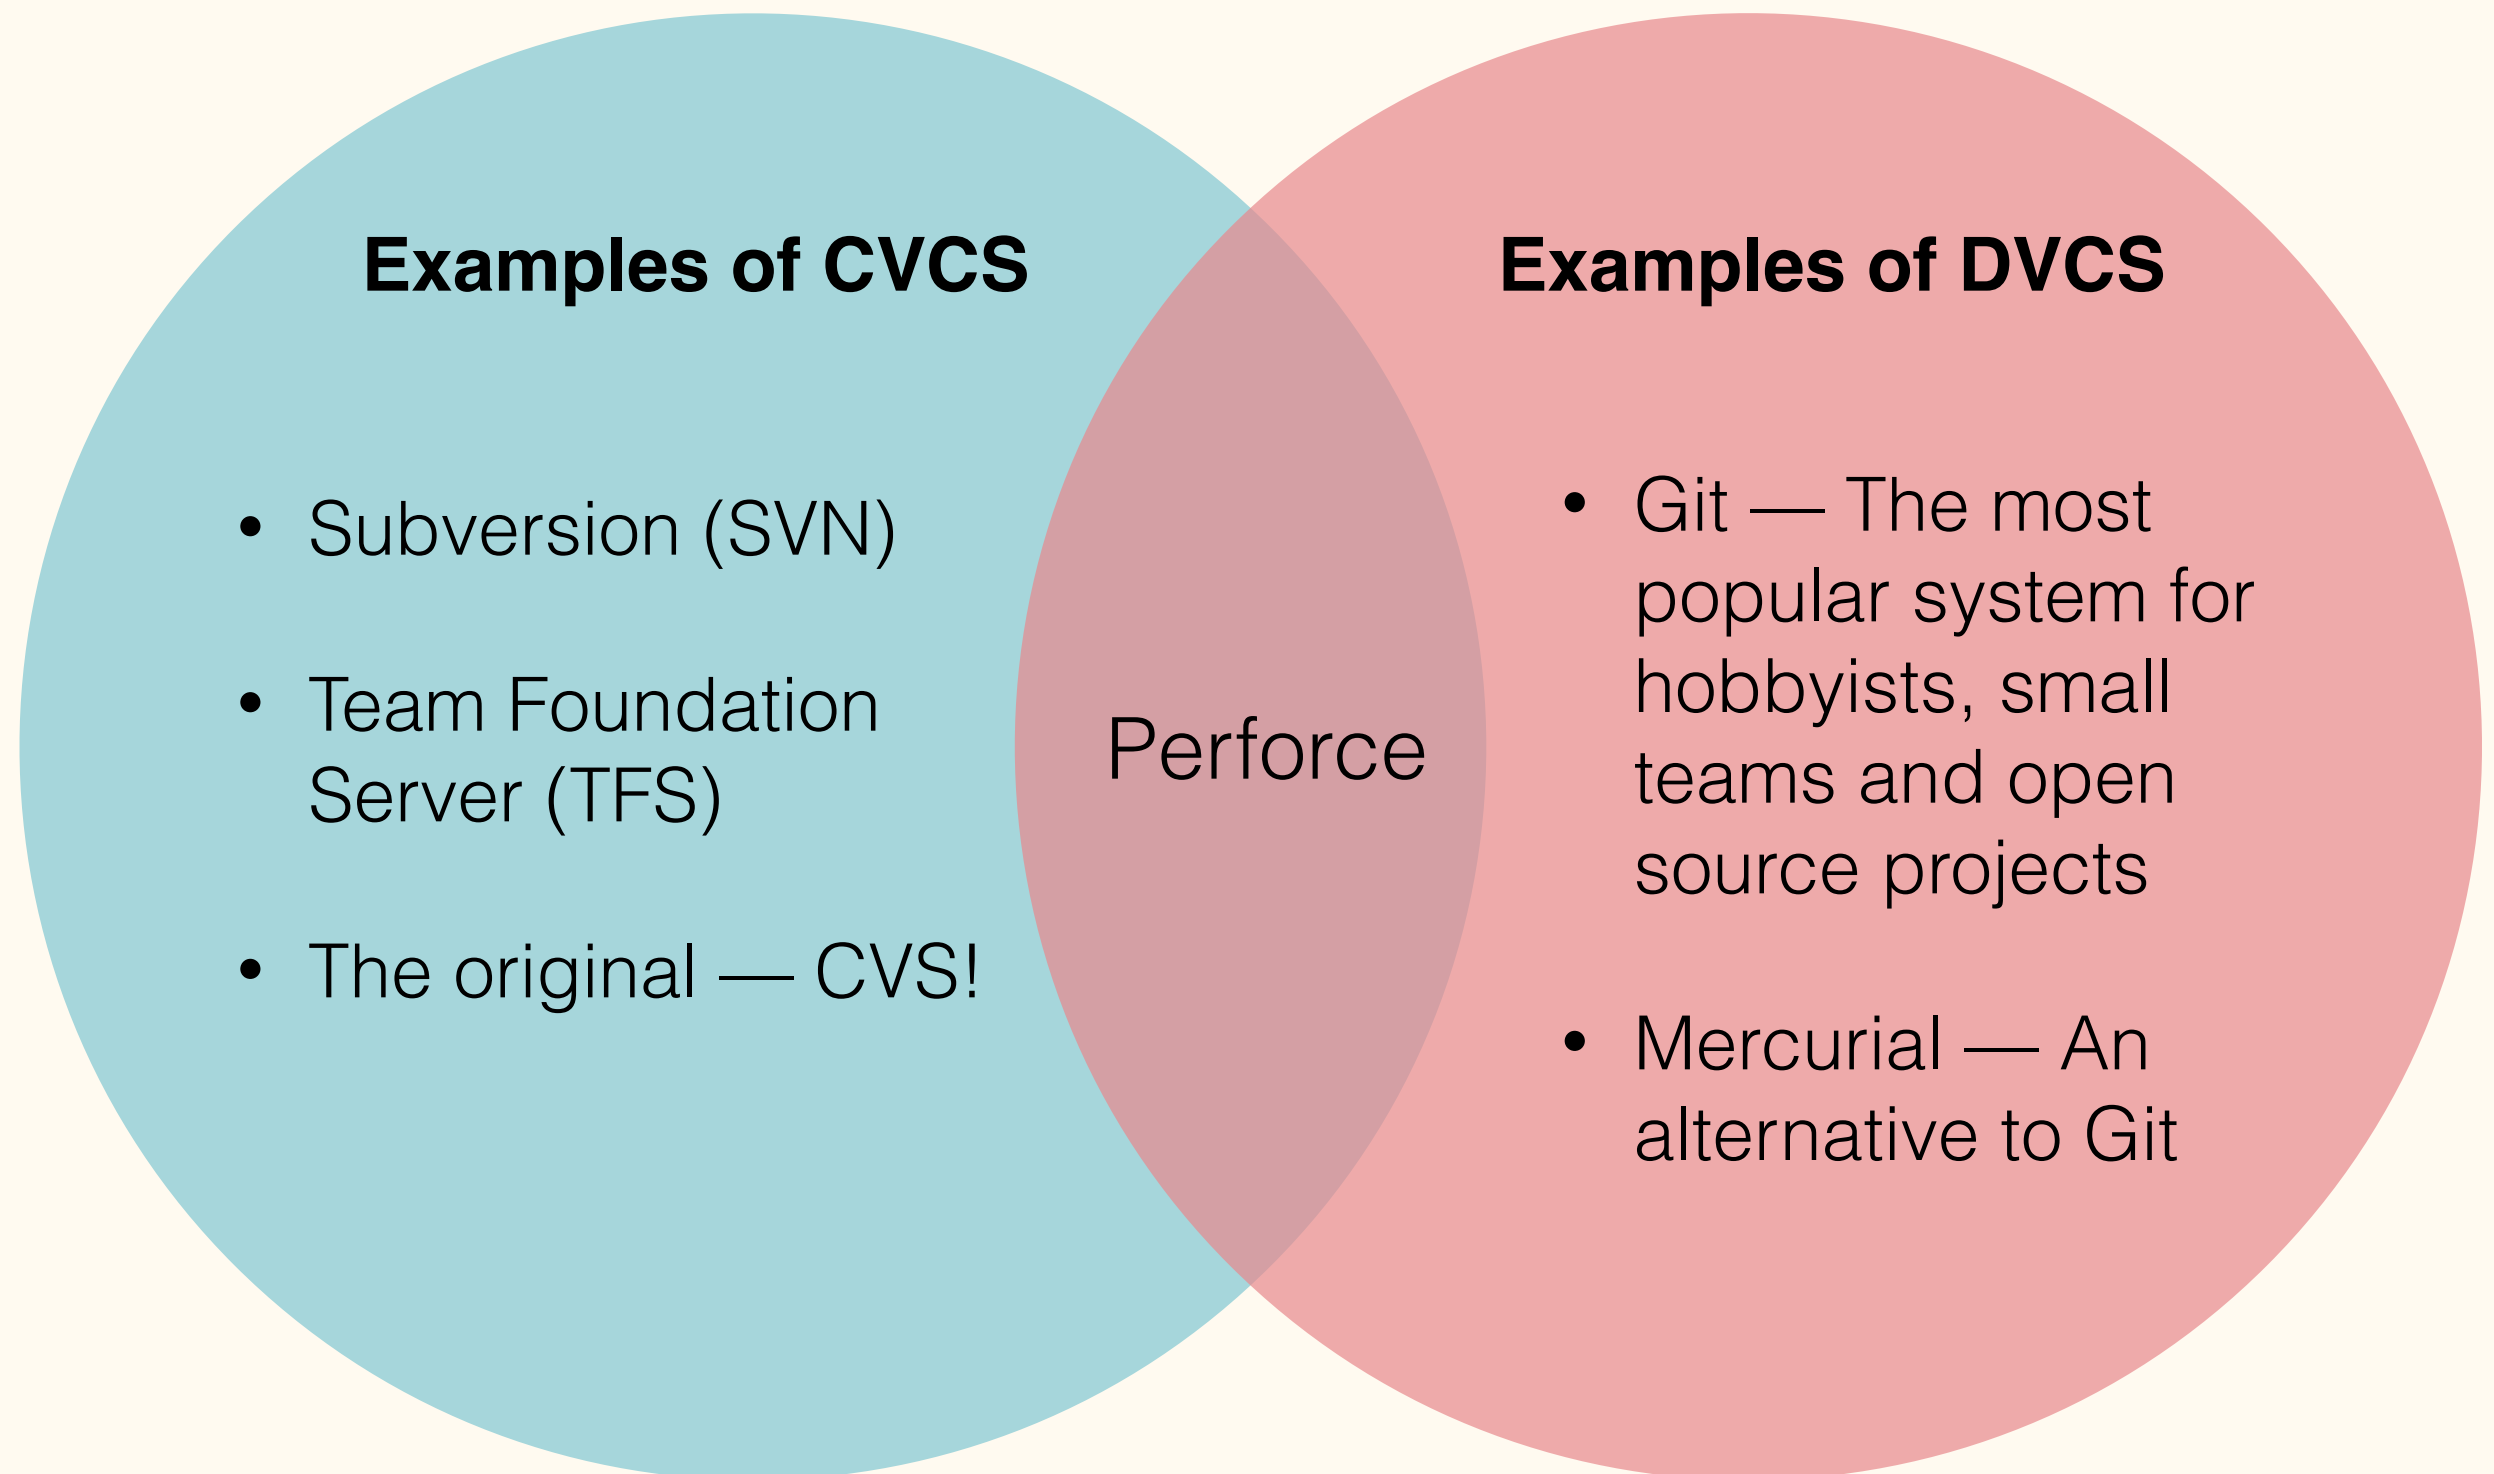

## Distributed (DVCS)

- Local tree synced to remote tree
- Great for projects with many contributors, inconsistent network access, and a reliance on derivation

# Types of Version Control

- Developed in 2005 to replace the VCS for the Linux project
- Popularity soared in 2008 after the release of GitHub, a social coding and remote source code host

# Git - CLI Workflow

*(CLI - Command Line Interface)*

- Git was designed for the command prompt
- Basic Commands
  - git status
  - git add .
  - git diff --cached
  - git commit -m "<message>"
  - git pull --rebase
  - git push

```
aaronsky at Alum-Clam in ~/Repos/learnVCS on dev*
$ git status
On branch dev
Your branch is up-to-date with 'origin/dev'.
Changes not staged for commit:
  (use "git add <file>..." to update what will be committed)
  (use "git checkout -- <file>..." to discard changes in working directory)

        modified:   app/404.html
        modified:   app/src/helpers/ErrorHandler.js

no changes added to commit (use "git add" and/or "git commit -a")

```

# Git - CLI Workflow

*(CLI - Command Line Interface)*

- `git commit -m "<message>"`

```
aaronsky at Alum-Clam in ~/Repos/learnVCS on dev*  
$ git commit -m "Updated 404.html and enhanced error responses"  
[dev 94c158e] Updated 404.html and enhanced error responses  
2 files changed, 10 insertions(+), 12 deletions(-)
```

## Common Gotchas

- Be as descriptive as possible in your commit messages. Once pushed, this history cannot be changed easily!

# Git - CLI Workflow

*(CLI - Command Line Interface)*

## Common Gotchas

- git pull --rebase
- git push
- **Always pull before you push!**
- Rebasing before merging can help reduce merge conflicts

```
aaronsky at Alum-Clam in ~/Repos/learnVCS on dev
$ git pull --rebase
git pushCurrent branch dev is up to date.
aaronsky at Alum-Clam in ~/Repos/learnVCS on dev
$ git push
fatal: unable to access 'https://github.com/learnVCS/learnVCS/': Failed to connect to github.com port 443: Operation timed out
aaronsky at Alum-Clam in ~/Repos/learnVCS on dev
$ git push

# Git - GUI Workflow

- Supports Git and Mercurial
- Integration with GitHub, Bitbucket and GitLab
- Full support for everything you can do in the command line
- [https://  
www.sourcetreeapp.com/](https://www.sourcetreeapp.com/)

- Built in support for TFS and Git
- Integration with GitHub and Visual Studio Online
- Support for common commands

# GitHub

- Remote code hosting service
- Host your projects publicly for free and privately for a fee
  - Students get one free private repository
- Designed for social coding, many features for collaboration

# Classroom for **GitHub**

- Instructors can use this to create groups of repositories for an assignment and monitor progress.
- <https://classroom.github.com/>

# learnVCS

- <http://learnvcs.github.io/>
- Created to address gaps in version control education in the IGM curriculum
- Interactive visualizations of projects hosted on GitHub
- Links to some of the best resources for learning more about version control and how to use tools like Git, Subversion, and more
